

Acrypel

Product Profile

Brick, mortar and concrete were all treated with Acrypel to stop water intrusion and to protect the attractive plaza at a university campus

About Acrylabs Acrypel:

Acrypel is a water based, penetrating sealer used to treat masonry surfaces and prevent water intrusion. A pump sprayer is used to flood coat and saturate the surfaces of brick, mortar and other cementitious materials to create a hydrophobic barrier that prevents the intrusion of water.

The exterior restoration of an historic Masonic Temple began with removal of old coatings to expose the original brick and masonry and Acrypel was then applied as a water repellent to preserve the surface

Tilt up concrete structures treated with Acrypel to keep out water and moisture
